Exchange and Industry Sponsored Webinars are presented by unaffiliated third parties. Interactive Brokers LLC is not responsible for the content of these presentations. You should review the contents of each presentation and make your own judgment as to whether the content is appropriate for you.

Interactive Brokers LLC does not provide recommendations or advice. This presentation is not an advertisement or solicitation for new customers. It is intended only as an educational presentation.

Disclosure:

Options involve risk and are not suitable for all investors. For information on the uses and risks of options, you can obtain a copy of the Options Clearing Corporation risk disclosure document titled [Characteristics and Risks of Standardized Options](#) by calling (312) 542-6901.

Futures are not suitable for all investors. The amount you may lose may be greater than your initial investment. Before trading futures, please read the [CFTC Risk Disclosure](#). For a copy visit interactivebrokers.com.

Security futures involve a high degree of risk and are not suitable for all investors. The amount you may lose may be greater than your initial investment. Before trading security futures, please read the [Security Futures Risk Disclosure Statement](#). For a copy visit Interactivebrokers.com.

There is a substantial risk of loss in foreign exchange trading. The settlement date of foreign exchange trades can vary due to time zone differences and bank holidays. When trading across foreign exchange markets, this may necessitate borrowing funds to settle foreign exchange trades. The interest rate on borrowed funds must be considered when computing the cost of trades across multiple markets.

The Order types available through Interactive Brokers LLC's Trader Workstation are designed to help you limit your loss and/or lock in a profit. Market conditions and other factors may affect execution. In general, orders guarantee a fill or guarantee a price, but not both. In extreme market conditions, an order may either be executed at a different price than anticipated or may not be filled in the marketplace.

There is a substantial risk of loss in trading futures and options. Past performance is not indicative of future results.

Any stock, options or futures symbols displayed are for illustrative purposes only and are not intended to portray recommendations.

RESEARCH

A Multi-Factor Approach to Stock Selection Using Earnings Estimate Revisions, Price Trends, and Valuation

EXCLUSIVE PRESENTATION FOR:

 **InteractiveBrokers**

PREPARED BY:

Sam Burns, CFA

Chief Strategist

info@millstreetresearch.com

508-655-1896

September 2021

Contents

A review of our stock selection research and findings

- Which stock selection factors we have studied and why
 - Earnings estimate revisions
 - Price momentum and mean-reversion
 - Valuation (absolute and relative)
- Summary results of individual factors and combinations of factors
- The importance of a multi-factor approach to stock selection

Example of how we implement these factors in our multi-factor stock selection tool, MAER.

- MAER is the tool which implements our major research results and presents them in a useful format for busy investors and analysts.
- We summarize the MAER stock ranking model along with some backtest results.
- We show examples of strong and weak stocks based on current indicator readings.

Some of Our Views on Stock Selection

- Financial markets, especially the stock market, are **complex systems** and it is very difficult to navigate them using any single piece of information.
- Professional investors very rarely rely on any single “best” indicator alone, regardless of their investment style – **a multi-factor approach is crucial.**
- Choosing your **time horizon** and **investment universe** first helps guide choices of information to use.
- A **disciplined, quantitatively-driven approach** can go a long way to avoiding harmful biases and emotions in investing, but must be done carefully and with the knowledge that there are limits to what the data can do.

Stock Selection Drivers

Our research focus for stock selection has been:

Universe: global equities that meet minimum requirements for investability

Time Horizon: typical range from one to six months, sometimes shorter

Key drivers, in order of importance in our work:

- **Earnings estimate revisions:** a measure of “fundamental momentum” that works well on one- to six-month horizons.
- **Price momentum and mean reversion:** intermediate-term trend/momentum along with short-term price reversal tendencies.
- **Valuation:** both absolute and relative valuation, used as longer-term measures of mean-reversion and risk control.

While these drivers have been found useful individually, in our view a multi-factor approach that incorporates all of them should be more robust and reliable.

Why These Factors?

Our focus on estimate revisions, price trends and valuation is based on a combination of factors.

- **Effectiveness:**

Extensive academic and practitioner research, including ours, supports the case that these factors can take advantage of behavioral anomalies to produce alpha.

- **Time Horizon:**

Estimate revisions and price momentum are known to be most effective on intermediate-term horizons (three to six months). Valuation is often used for similar or longer-term horizons, price mean-reversion is effective on shorter horizons.

- **Global Availability and Timeliness:**

Earnings estimates and prices are available globally, with little or no reporting lag or historical revisions/restatements.

Earnings Estimate Revisions

One of the factors we have studied and used for a long time is **earnings estimate revisions**.

The underlying concept is that **changes** (revisions) in analysts' forecasts for a company's profits are a predictor of future relative returns.

KEY ASSUMPTIONS

Estimate revisions impact stock prices.

Estimate revisions tend to move in trends.

SUPPORTING RESEARCH

Investors respond to estimate revisions, but tend to underreact to the news embedded in analyst forecast revisions. This allows price trends in response to revisions to form.

Equity analysts often have incentives or biases that cause them to:

1. Change their earnings forecasts incrementally
2. Move in herds

Earnings Estimate Revisions

Two key revisions metrics:

1. Revisions Breadth = “How Many”

The **net proportion** of analysts covering a stock that have raised estimates versus lowered them in the last X days (we normally use X = 100 days). This is “how many estimates are going up or down”.

2. Revisions Magnitude = “How Much”

The **percent change** in the consensus (mean) earnings estimate over the last X days (we normally use 1 month). This is “how much have estimates gone up or down.”

To account for widely varying volatilities across stocks and control risk, we scale the percent changes in the context of each stock’s trailing 5-year range to produce a percentile score (0 - 100).

Revisions Persistence

A key reason for focusing on the **direction** of estimate revisions (which way the majority of analysts are moving their estimates) is that it is much more **persistent** and thus **predictable** than returns.

A few results from our studies¹:

- The direction of revisions breadth persists from one month to the next about **83% of the time** historically.
- Revisions breadth trends tend to last an average of about **5.5 months**, some last much longer.

BOTTOM LINE: Simply knowing the current direction of revisions provides some predictability for the future direction of revisions over the next several months.

¹ Mill Street MAER Background and Product Overview, internal Mill Street research

Why Are Revisions Persistent?

FUNDAMENTAL BUSINESS TRENDS

- Trends in a business' underlying sales and profits can persist over multiple quarters or years.
- Longer-term forecasting is very difficult and thus **a focus on near-term (i.e., next quarter/year) results often dominates**, leading to “surprises” when longer-term trends develop.

ANALYST BEHAVIORAL BIASES/INCENTIVES

- Analysts have significant **incentives and biases** related to earnings forecasting:
- Access to company management is important to analysts.
- Incentive not to deviate too far from the consensus.

Revisions and Returns

- Stocks with strong revisions tend to have **higher returns and lower volatility** than stocks with weak revisions.
- Higher revisions forecast significantly stronger **risk-adjusted future returns**.
- The combination of breadth and magnitude rankings shows even more favorable results.

REVISIONS INDICATORS ONLY: Global Stock Universe, 2003–Present			
	Ann. 1-mth Return (%)	Ann. 1-mth Volatility (%)	Return/Risk Ratio
Revisions Breadth			
Top Decile	16.4	17.3	0.95
Bottom Decile	10.2	21.1	0.48
Revisions Magnitude			
Top Decile	14.3	16.8	0.85
Bottom Decile	10.6	19.9	0.53
Breadth + Magnitude			
Top Decile	16.3	16.7	0.98
Bottom Decile	10.2	21.0	0.48

Note: All results shown above are hypothetical and do not represent any actual trading. Mill Street Research does not manage money. The results shown do not include important considerations such as transactions costs or taxes, and may not have been achievable in practice. See important disclosures at the end of this document.

Risk-Adjusted Price Momentum

A lot of research supports intermediate-term momentum: **returns over the prior 6-12 months can be used to forecast returns over the next 3-6 months.**

However, momentum performance can be volatile.

Why? Often due to the “beta” effect: i.e., momentum will overweight high beta stocks at market peaks (and vice versa).

To address this, instead of traditional price momentum, we use what we call **“Alpha Momentum”**.

We use regression to estimate the “alpha” or **stock-specific return** after accounting for a stock’s market beta, size (small/large-cap) and style (value/growth) tendencies.

Removing the “beta bets” from a momentum strategy helps returns and reduces risks.

Alpha Momentum with Mean-Reversion

We combine intermediate-term price momentum from Alpha Momentum with short-term price mean-reversion to counter the risks of buying stocks which have just recently surged (i.e., overbought).

The combination shows wider top-bottom return spreads and a more stable linear relationship with returns than either of the components.

Global Momentum Ranks
Annualized Next-Month Returns (%), 2003 - Present

Decile	Alpha Momentum	1-Month Mean Reversion	Combined
10	16.7	15.2	16.1
9	13.4	14.0	14.6
8	13.4	13.7	13.5
7	13.0	12.7	13.0
6	12.3	12.2	11.6
5	11.3	11.8	12.4
4	10.6	10.5	11.7
3	11.3	10.7	12.6
2	10.3	11.1	11.4
1	11.1	10.9	6.4

NOTE: All results shown above are hypothetical and do not represent any actual trading. Mill Street Research does not manage money. The results shown do not include important considerations such as transactions costs or taxes, and may not have been achievable in practice. See important disclosures at the end of this document.

Valuation: Relative and Absolute

Problem: Momentum-oriented strategies are frequently biased toward “expensive” stocks.

Solution: Incorporate valuation metrics alongside revisions and momentum

Two valuation metrics help balance potential momentum/growth bias:

Absolute forward earnings yield (higher is better):

- Consensus mean EPS expected over the next 12 months as a percentage of current stock price

Relative forward earnings yield (higher is better):

- Forward earnings yield minus the earnings yield of the market, scaled to the stock’s trailing 5-year range

Result: Valuation metrics help to avoid the most expensive (i.e., risky) holdings in the context of a momentum-oriented strategy and improves risk-adjusted results.

Valuation Results

Quantitative value factors have struggled in recent years, but our data shows there is still “value in value”.

Combining two versions of valuation helps avoid big sector biases.

Global Valuation Ranks
Annualized Next-Month Returns (%), 2003 - Present

Decile	Absolute Earn Yld	Relative Earn Yld	Combined
10	15.7	14.0	14.9
9	12.9	12.3	13.3
8	12.3	11.8	11.9
7	12.6	12.0	12.7
6	12.1	12.1	12.0
5	12.3	12.7	12.3
4	12.2	11.8	11.8
3	11.3	12.2	11.6
2	11.1	12.4	11.8
1	11.1	11.8	11.1

The results shown do not include important considerations such as transactions costs or taxes, and may not have been achievable in practice. See important disclosures at the end of this document.

Summary of Indicator Research

We have reviewed six stock selection factors from three categories: earnings revisions, price momentum and valuation.

Each indicator can be shown to “work” on its own

The results are stronger and more consistent when the indicators are combined.

We have confidence in our analysis because it is based on:

- A broad global universe of stocks (over 5000 stocks in recent years) meeting minimum investability criteria
- A substantial time period (18 years)
- Results that are generally consistent across regions, sectors and time periods

What Do These Indicators Look Like?

As an example of how these stock selection tools could be used in practice, we can look at charts of a few stocks using Mill Street's MAER tool. MAER is the **Monitor of Analysts' Earnings Revisions**, Mill Street's proprietary stock selection tool. It is made up of two key components:

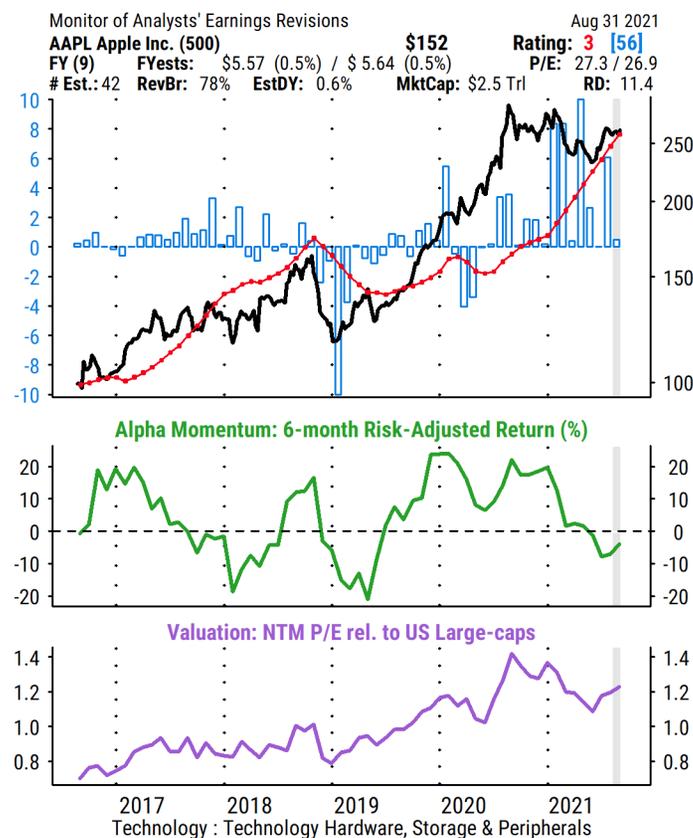

A Multi-Factor Ranking Model

Top 20 Ranked Global Large-Cap Stocks

Ticker	Name	Composite MAER Rank
STLA-IT	Stellantis N.V.	1.000
MT-US	ArcelorMittal SA	0.999
8031-JP	Mitsui	0.998
CM-CA	Canadian Imperial Bank of	0.997
2882-TW	Cathay Financial Holdings	0.996
NTR-US	Nutrien	0.995
MT-NL	ArcelorMittal SA	0.994
HLAG-DE	Hapag-Lloyd AG	0.993
NTR-CA	Nutrien	0.992
SPG-US	Simon Property Group	0.991
728-HK	China Telecom Class H	0.990
TGT-US	Target	0.989
MAERSK.B-DK	A.P. Moller - Maersk A/S	0.988
HMC-US	Honda Motor Sponsored	0.987
TM-US	Toyota Motor Sponsored	0.986
7267-JP	Honda Motor	0.985
SGO-FR	Compagnie de Saint-Gobain	0.984
STLA-US	Stellantis N.V.	0.982
7203-JP	Toyota Motor	0.981
PSA-US	Public Storage	0.980

NOTE: The list above is for demonstration purposes only and is not a recommendation to buy or sell any security.

MAER Charts

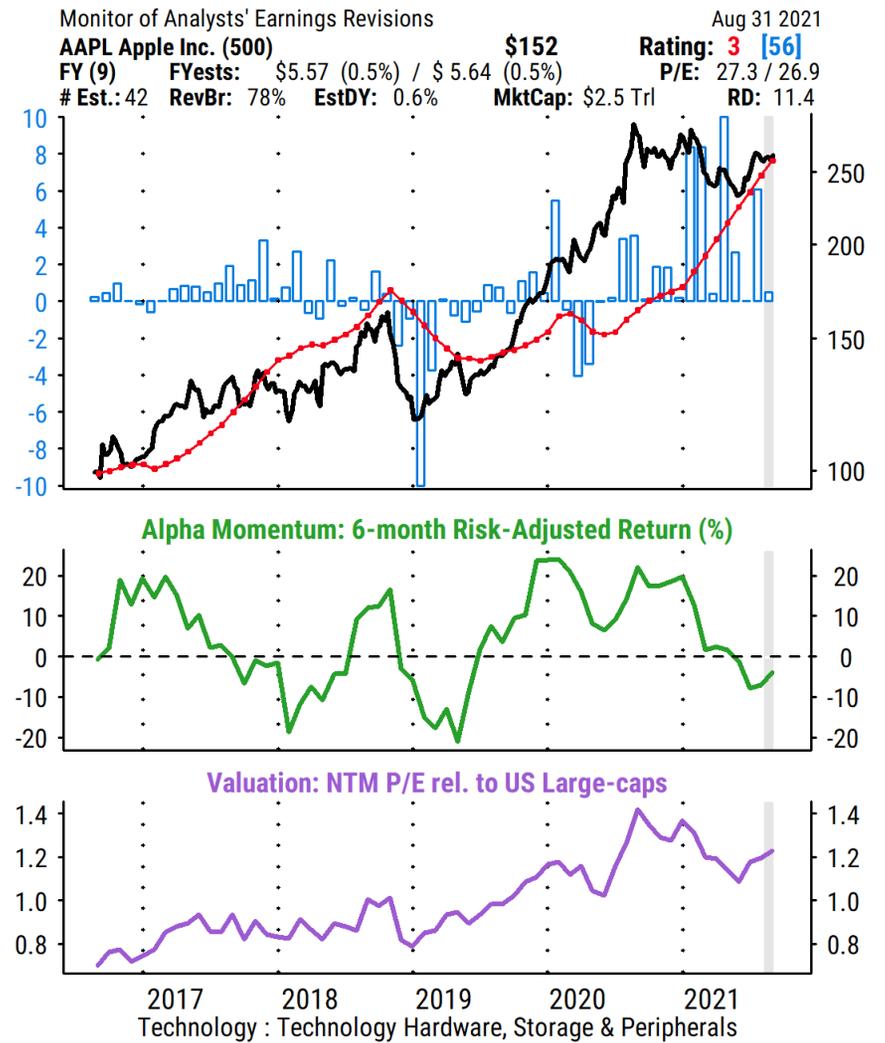

Source: Mill Street Research, Factset

MAER Charts

MAER charts incorporate a significant amount of current and historical information into a single picture and provide useful context for the indicators and rankings.

- The main section of the chart depicts the trends in analyst estimate revisions for each stock over the last five years, showing both the direction and magnitude of the monthly revisions activity. These indicators are overlaid on *relative* returns.
- In addition to the revisions indicators, it plots our measure of risk-adjusted six-month price momentum (Alpha Momentum) and relative valuation based on forward P/E.
- The header data shows current values for key variables for the company.

Source: Mill Street Research, Factset

MAER Ranking

The **MAER Ranking Model** uses six inputs to objectively rank stocks in any universe and help identify stocks with the most, or least, favorable combination of earnings revisions, price action and valuation. The indicators and their weights have been fixed since the model was developed in 2013. They were chosen to reflect the relative importance of each input for a 1-6 month forecasting horizon and manage risk and turnover.

INDICATOR

WEIGHTING

• Revisions breadth	30%
• Revisions magnitude	20%
Revisions inputs total	50%
• Alpha Momentum	20%
• Prior month return	10%
Price inputs total	30%
• Relative forward earnings yield vs. history	10%
• Absolute earnings yield	10%
Valuation inputs total	20%

MAER Ranking

The MAER ranking model has been backtested back to 2003 and shows solid results in our testing based on top versus bottom decile stocks: higher returns and lower volatility for high-ranked stocks vs. low-ranked stocks. These results reflect monthly rebalancing, but we find three-month and even six-month rebalancing frequencies also show good results.

Global & US MAER Ranking Decile Backtest Summary

	Global Top Decile	Global Bottom Decile	Global Benchmark	US Top Decile	US Bottom Decile	US Benchmark
Ann. Return (%)	18.19	7.16	11.73	14.89	7.64	11.32
Ann. Std. Dev. (%)	17.32	18.46	16.01	23.80	26.15	22.70
Sharpe Ratio	0.98	0.32	0.66	0.57	0.25	0.45

Source: Mill Street Research

All returns shown are hypothetical percentage total returns in local currency for equal-weighted portfolios based on monthly rebalancing using the MAER ranking process. "Benchmark" = benchmark returns based on equal-weighted total return for full indicated MAER universe as of each monthly rebalancing. Data for May 2003 - September 2021.

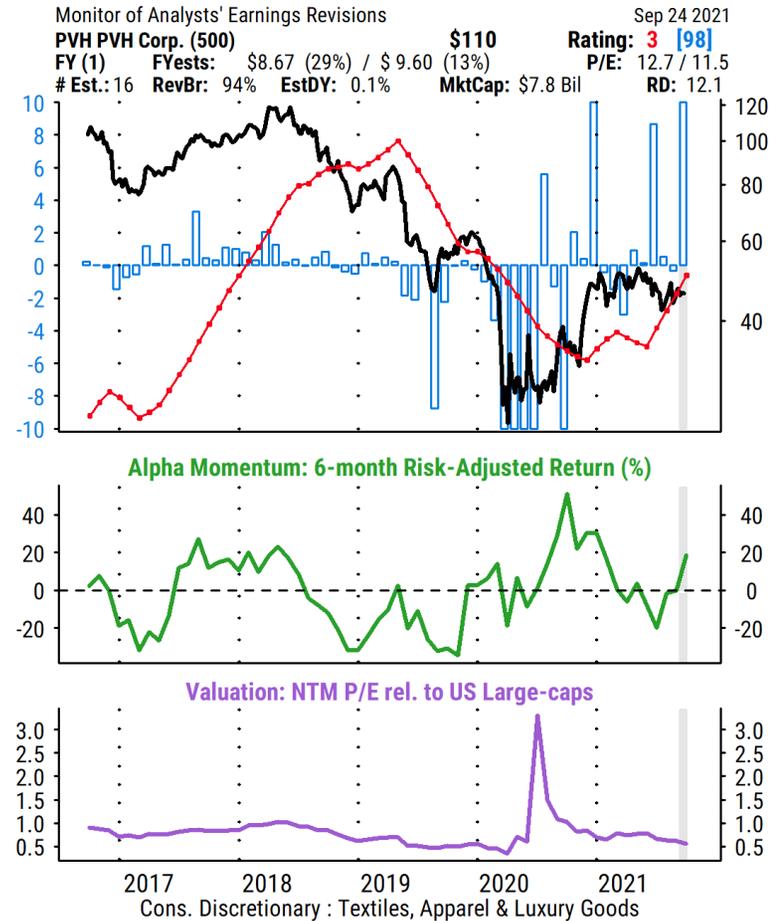

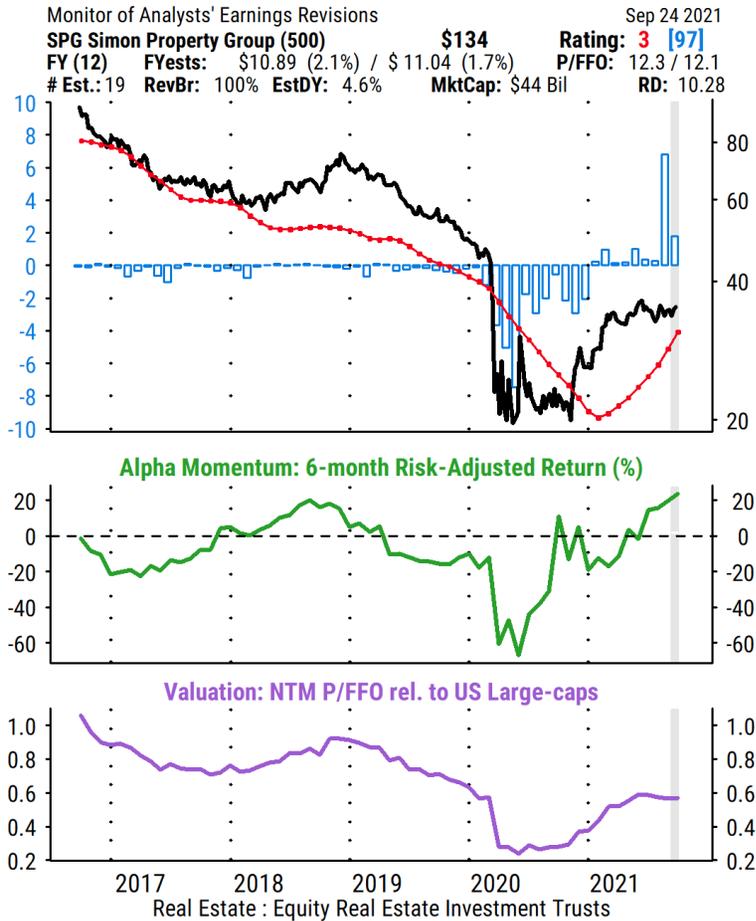

Backtest results do not reflect any actual trading, and actual results could vary significantly from backtest results. Past performance is no guarantee of future results. No transactions costs or other expenses included in the above figures.

How Do Clients Use Tools Like MAER?

While there are many ways clients can use quantitative stock selection tools and incorporate them into their investment process, we find three primary ways that clients use them:

1. An initial stock screen

Clients looking for new stock ideas to potentially research often screen the list of highly-ranked stocks to find names that stand out on the quantitative metrics. Knowing that highly-ranked stocks have historically tended to outperform on average helps narrow the focus onto favorable indicator profiles and make research more efficient.

2. Check against current holdings

Clients also like to review their current or proposed holdings against the objective message from the multi-factor analysis. Holdings that have weak profiles can be scrutinized more closely (or sold), and strong profiles can corroborate other fundamental or technical analysis inputs.

3. Quantitative model input

Process-oriented clients use quantitative rankings directly as an input to their own process as a way to combine alpha sources.

About the Firm

- Mill Street Research is an independent research provider owned and operated by Sam Burns, CFA.
- Sam has over 20 years of experience as a market strategist, providing analysis and commentary to institutional investors globally.
- Prior to founding Mill Street Research in 2016, Sam Burns, CFA worked as a senior strategist at leading firms including Oppenheimer & Co., Brown Brothers Harriman, State Street Global Markets, and Ned Davis Research.
- Mill Street Research provides a suite of consistently updated research reports and data for institutional investors covering asset allocation, country allocation, sector and industry selection, and a robust quantitative stock selection process.
- We also provide customized work and special research projects for clients globally.

Important Disclosures & Certifications

The research provided in this report is based on strategic analysis provided by Mill Street Research, LLC (“Mill Street”), an investment adviser registered with the Massachusetts Securities Division. Strategic analysis is based on fundamental, macroeconomic and quantitative data to provide investment analysis with respect to the securities markets. The report is not intended to provide personal investment advice. This report does not constitute an offer or solicitation to buy or sell any securities discussed herein in any jurisdiction where such offer or solicitation would be prohibited. The securities mentioned in this report may not be suitable for all types of investors. This report does not take into account the investment objectives, financial situation or specific needs of any particular client of Mill Street. Recipients should consider this report as only a single factor in making an investment decision and should not rely solely on investment recommendations contained herein, if any, as a substitution for the exercise of independent judgment of the merits and risks of investments. Mill Street has no actual, implied or apparent authority to act on behalf of any issuer mentioned in the report. Before making an investment decision with respect to any security recommended in this report, the recipient should consider whether such recommendation is appropriate given the recipient’s particular investment needs, objectives and financial circumstances. We recommend that investors independently evaluate particular investments and strategies, and encourage investors to seek the advice of a financial advisor. Mill Street will not treat non-client recipients as its clients solely by virtue of their receiving this report. Past performance is not a guarantee of future results, and no representation or warranty, express or implied, is made regarding future performance of any security mentioned in this report. The price of the securities mentioned in this report and the income they produce may fluctuate and/or be adversely affected by exchange rates, and investors may realize losses on investments in such securities, including the loss of investment principal. Mill Street accepts no liability for any loss arising from the use of information contained in this report.

All information, opinions and statistical data contained in this report were obtained or derived from public sources believed to be reliable, but Mill Street does not represent that any such information, opinion or statistical data is accurate or complete (with the exception of information contained in the Important Disclosures and Certifications section of this report), and they should not be relied upon as such. All estimates, opinions and recommendations expressed herein constitute judgments as of the date of this report and are subject to change without notice. Nothing in this report constitutes legal, accounting or tax advice. Since the levels and bases of taxation can change, any reference in this report to the impact of taxation should not be construed as offering tax advice on the tax consequences of investments. As with any investment having potential tax implications, clients should consult with their own independent tax adviser. This report may provide addresses of, or contain hyperlinks to, Internet web sites. Mill Street has not reviewed the linked Internet web site of any third party and takes no responsibility for the contents thereof. Each such address or hyperlink is provided solely for the recipient’s convenience and information, and the content of linked third party web sites is not in any way incorporated into this document. Recipients who choose to access such third-party web sites or follow such hyperlinks do so at their own risk. The market indices mentioned in this report are unmanaged, hypothetical portfolios of securities that are often used as a benchmark in evaluating the relative performance of a particular investment, as constructed by the index providers. Index return figures do not reflect any fees, expenses or taxes. An index should only be compared with a mandate that has a similar investment objective. An index is not available for direct investment, and does not reflect any of the costs associated with buying and selling individual securities or management fees. This report or any portion hereof may not be reprinted, sold, or redistributed without the prior written consent of Mill Street.

Important Disclosures & Certifications CONTINUED

The returns shown in this report are hypothetical and backtested and do not represent actual trading but were achieved by the retroactive application of a model. The hypothetical returns shown may not reflect that material market or economic facts may have affected Mill Street's use of the back-tested model. During the periods shown in the report, Mill Street was not managing any money in accordance with the investment strategy depicted. These hypothetical returns are unaudited and have not been verified by any unaffiliated third party. The hypothetical performance is presented gross of all brokerage and transaction costs unless otherwise specified. Such hypothetical performance also does not reflect management fees, performance allocation, legal, administration, audit and tax fees and other expenses an investor might incur.

Hypothetical performance results have many inherent limitations, some of which are described herein. No representation is being made that investors will or are likely to achieve profits or losses similar to those shown. In fact, there are frequently sharp differences between hypothetical performance results and the actual results subsequently achieved by any particular trading program. One of the limitations of hypothetical performance results is that they are generally prepared with the benefit of hindsight. In addition, hypothetical trading does not involve financial risk, and no hypothetical trading record can completely account for the impact of financial risk in actual trading. For example, the ability to withstand losses or adhere to a particular trading program in spite of trading losses are material points which can also adversely affect actual trading results. There are numerous other factors related to the markets in general or to the implementation of any specific trading program which cannot be fully accounted for in the preparation of hypothetical performance results and all of which can adversely affect actual trading results.

Past performance is no guarantee of future results. All investments involve risk, including the loss of principal. The value of investments can go down as well as up. This report does not constitute an offering to sell, or a solicitation of an offer to buy any security.

Mill Street Research is not affiliated with Interactive Brokers LLC, or any other FINRA broker-dealer.
